Using Instrunction

We reminds that the software has been designed and realised for industrial applications and it is strictly joint to the present Hardware with which it dialogues.

Then, any Software/Hardware modification to the P/C and/or to the software, or to the Devices into the field, even little and apparently not relevant, if executed by unauthorized people, and which do not know the system architecture, they could cause bad functioning of the software or Hardware managing sector or to the production lines, and in extreme cases also damages to things or to people.

Then in any case before assuming the control on the system, you must well read up on the current version of the system, and on each useful information so to avoid the generation of misalignment Software-Hardware with consequent damage coming by eventual errors which from CEAM will not be responsible in any case.
